This kit is manufactured by: BioVendor – Laboratorní medicína a.s.

Use only the current version of Product Data Sheet enclosed with the kit!
1. INTENDED USE

The RZ193094100 Human Intact Proinsulin ELISA is a sensitive two-site sandwich enzyme immunoassay for the quantitative measurement of human intact proinsulin.

Features

- **European Union: for in vitro diagnostic use**
  Rest of the world: for research use only!
- The total assay time is less than two hours
- The kit measures total intact human proinsulin in serum
- Calibrators are human serum based
- No dilution of serum samples
- Components of the kit are in the lyophilized, concentrated and ready-to-use states
- Convenient for automatization

2. STORAGE, EXPIRATION

Store the kit at 2-8°C. Under these conditions, the kit is stable until the expiration date (see label on the box).

For stability of opened reagents see Chapter 9.
3. INTRODUCTION

Proinsulin (PI), a polypeptide of 9390 MW (86 amino acids) is synthetized in the β cells of the Islets of Langerhans in the pancreas. The sequence of proinsulin is highly conserved in mammalian species and is homologous with IGF-1 and IGF-2. This protein is processed to C-peptide and insulin forms. Both are secreted in equimolar amounts into the blood. In normal individuals, proinsulin is present in the circulation in very low concentrations (typical basal values 2-6 pmol/l). The level of proinsulin in serum can be a reflection of β cell status and a consequence of dysfunction of PI processing and/or secretion. Proinsulin like material is increased in clinical conditions as insulinoma, familial hyperinsulinemia, non-insulin dependent diabetes mellitus.

Clinical applications
Proinsulin is the precursor of insulin, which is the principal hormone responsible for the control of glucose metabolism. The measurement of proinsulin in serum provides useful valuable information for the diagnosis of insulinomas. Proinsulin levels have also been shown to be elevated in non-insulin dependent diabetics (NIDDM), in insulin dependent diabetics (IDDM) and other clinical situations.

Area of investigation:
Diabetology

4. TEST PRINCIPLE

Prior to use a Blocking Buffer is added to the allocated wells in the BioVendor Human Intact Proinsulin ELISA. Then, Calibrators, Quality Controls and samples of sera are incubated in microtitation wells coated with a monoclonal anti-human proinsulin antibody (S2) specific for the epitope at the C-peptide/insuline A chain junction. S2 is able to bind intact PI, des (31,32)-PI and split (32,33)-PI but not insulin, C-peptide and the other “des” and “split” forms. Any human proinsulin present is captured by immobilized antibody and unbound protein is washed away after the first incubation period. Then, a horseradish peroxidase (HRP) labelled anti-human proinsulin antibody (S53) is added into the wells and incubated with proinsulin. This antibody is specific for the epitopes at insulin β chain/C-peptide junction. S53 is able to bind to intact PI, des (64, 65)-PI but not insulin, C-peptide and others “des” and “split” form. Following another washing step, to remove unbound antibody-HRP conjugate, the substrate solution is added to the wells. The enzymatic reaction yields a blue product that turns yellow when acidic Stop Solution is added. Absorbance of the resulting yellow colour product is measured. The intensity of colour development is proportional to the concentration of human proinsulin. A standard curve is constructed by plotting absorbance values against concentrations of proinsulin calibrators using a four-parameter function, and concentrations of unknown samples are determined using this standard curve.

The combination of the two MAbs has the ability to detect only the intact human proinsulin.
5. PRECAUTIONS

- For professional use only
- Use disposable gloves while handling potentially infectious material and performing the assay.
- Do not pipette reagents by mouth.
- Do not smoke, eat, drink or apply cosmetics during the assay.
- All material of human origin used for the preparation of this kit is tested negative for HBsAg, anti-HIV and anti-HCV. Since no test at present can guarantee complete absence of these viruses, all samples and reagents used for the assay must be considered potentially infectious; therefore, the assay waste must be decontaminated and disposed off, in accordance with established safety procedures. Disposable ignitable material must be incinerated; disposable non-ignitable material must be sterilized in autoclave for at least 1 hour at 121°C. Liquid wastes must be added with sodium hypochlorite at a final concentration of 3%. Let the hypochlorite act for at least 30 minutes. Liquid wastes containing acid must be neutralized with appropriate amounts of base before treating with sodium hypochlorite.
- Avoid splashing and aerosol formation; in case of spilling, wash carefully with a 3% sodium hypochlorite solution and dispose of this cleaning liquid as potentially infectious waste.
- Some reagents contain sodium azide as preservative; to prevent buildup of explosive metal azides in lead and copper plumbing, reagents should be discarded by flushing the drain with large amounts of water.
- Chromogenic substrate and Stop solution should be handled with care. Avoid contact with skin, eyes and mucous membranes. In case of accident rinse thoroughly with running water.
- Calibrators contain Thimerosal. This product is highly toxic by inhalation, swallowing and contact with skin. Keep away from food and drink.
- Wear protective clothers and gloves. In case of contact with skin or eyes, rinse thoroughly with water. In case of accident, consult immediately a physician and show him/her the product label.
- Stop solution contains sulfuric acid (4.9% w/w) (H331/H314/H315)

Risk phrases

H331 toxic by inhalation
H314 causes burns
H315 irritating skin

6. TECHNICAL HINTS

- Do not mix reagents from different lot numbers or from other manufacturers.
- Do not freeze kits.
- Strict adherence to the specific time and temperature of incubations is recommended for accurate results.
- Allowing the micro well strip and reagents to equilibrate to room temperature before opening and using them.
- Do not use reagents after their expiration dates.
- Incomplete or inefficient washing will cause poor precision and high background.
- Use thoroughly clean glassware, free from contamination of metal ions or oxidating substances.
- Use distilled water, stored in clean containers.
- Microbial contaminated serum or specimens containing heavy, visible particulate should not be used.
- Cross contaminations of reagents or sample could cause false results. Use a clear, fresh, disposable pipette tip for each reagent of specimen manipulation.
- Do not expose the substrate to light during storage or incubation.
- Follow exact incubation times. Dispense Chromogen and Stop solution in no more than 3-4 minutes; dispense the two reagents in the same sequence.
- Residual amounts of sodium azide (NaN₃) can destroy the conjugate's enzymatic activity.
- Traces of hypochlorite of soda can destroy many reagents' biological activity.

A variety of factors influence the assay performances. These include the accuracy and reproducibility of pipetting technique, the photometer used, timing bias during the assay.

8. MATERIAL REQUIRED BUT NOT SUPPLIED

- Deionized (distilled) water
- Glassware (graduated cylinder and bottle) for Wash Solution
- Precision pipettes to deliver 10-1000 µl with disposable tips
- Multichannel pipette to deliver 50-200 µl with disposable tips
- Orbital microplate shaker capable of approximately 150 rpm
- Microplate washer (optional). [Manual washing is possible but not preferable.]
- Absorbent material (e.g. paper towels) for blotting the microtitrate plate after washing
- Microplate reader with 405 and 450 nm filters, preferably with reference wavelength 630 nm (alternatively another one from the interval 550-650 nm)
- Software package facilitating data generation and analysis (optional)

9. PREPARATION OF REAGENTS

- All reagents need to be brought to room temperature prior to use
- Always prepare only the appropriate quantity of reagents for your test
- Do not use components after the expiration date marked on their label

- Assay reagents supplied ready to use:

Antibody Coated Microtiter Strips

**Stability and storage:**

Return the unused strips to the provided aluminium zip-sealed bag with desiccant and seal carefully. Remaining Microtiter Strips are stable 3 months stored at 2-8°C and protected from the moisture.

Blocking Buffer
Conjugate Solution
Substrate Solution
Stop Solution

**Stability and storage:**

Opened reagents are stable 3 months when stored at 2-8°C.

- Assay reagents supplied concentrated or lyophilized:

Proinsulin 0 Calibrator:
Reconstitute Proinsulin 0 Calibrator with 3.0 ml of deionized (distilled) water. Mix gently the reconstituted Calibrator 0 and allow it to sit for about 10 minutes optimally (to ensure complete reconstitution). Avoid foaming when reconstituting or mixing the protein solutions.

**Stability and storage:**
Reconstituted Calibrator should be frozen at -20°C until next use. Avoid multiple freeze-thaw cycles (max. 2 times). Reconstituted Calibrator is stable until the expiration date (see label on the vial) if stored under this condition.

**Proinsulin 1-5 Calibrators:**
Reconstitute Proinsulin 1-5 Calibrators with 1.0 ml of deionized (distilled) water. Mix gently reconstituted Calibrators and allow them to sit for about 10 minutes optimally (to ensure complete reconstitution). Avoid foaming when reconstituting or mixing the protein solutions.

The Calibrators are calibrated against the 1st International Standard WHO 09/296.

**Stability and storage:**
Reconstituted Calibrators should be frozen at -20°C until next use. Avoid multiple freeze-thaw cycles (max. 2 times). Reconstituted Calibrators are stable until the expiration date (see label on the vial) if stored under this condition.

**Quality Controls- High, Low**
Reconstitute Quality controls with 1.0 ml of deionized (distilled) water. Mix gently the reconstituted Quality Controls and allow them to sit for about 10 minutes optimally (to ensure complete reconstitution). Avoid foaming when reconstituting or mixing the protein solutions.

Thus reconstituted Quality Controls are ready to use.

**Stability and storage:**
Reconstituted Quality Controls are stable until the expiration date (see label on the vial) if stored at -20°C. Avoid multiple freeze/thaw cycles (max. 2 times).

**Wash Solution**
Quantitatively dilute 40 ml of Wash Solution Concentrate (10x) with 360 ml of deionized (distilled) water to the final total volume 400 ml of Wash Solution (1x) and mix thoroughly.

**Stability and storage:**
The diluted Wash Solution is stable for 6 months if stored at 2-8°C.
10. PREPARATION OF SAMPLES

It is recommended to use serum samples. Avoid using hemolyzed, lipemic or bacterially contaminated sera.

The samples are not diluted!

Mix thoroughly thawed samples just prior to the assay and avoid repeated freeze-thaw cycles, which may cause loss of antibody activity and give erroneous results.

Stability and storage:
Samples may be stored at 2-8°C for up to 24 hours. For long-term storage, samples should be stored frozen at -20°C, or preferably at -70°C.

Note: It is recommended to use a precision pipette and a careful technique to perform the dilution in order to get precise results!
11. ASSAY PROCEDURE

1) Prepare reagents as directed in the previous sections. Remove excess microplate strips from the plate frame.
2) Allocate the wells of Microtiter Plate for calibrators, control sera and samples. See Figure 1 for example of work sheet.
3) Pipette 10 μl of Blocking Buffer directly into the bottom of the wells except blanks.
4) Pipette 100 μl of reconstituted Calibrators (0-5), Quality controls and samples, preferably in duplicates, into the appropriate wells. Leave the G1, G2 wells empty (=Blank).
5) Incubate the plate at room temperature (ca. 25°C) for 30 minutes, shaking at ca. 150 rpm on an orbital microplate shaker. (The incubation time begins after the last sample addition).
6) Wash the wells 3-times with diluted Wash Solution (0.35 ml per well). Aspirate all liquid from the wells. Invert the plate and blot it against a clean paper towels to remove the remaining Washing Buffer.
7) Add 100 μl of Conjugate Solution into each well except Blank.
8) Incubate the plate at room temperature (ca. 25°C) for 1 hour, shaking at ca. 150 rpm on an orbital microplate shaker.
9) Wash the wells 3-times with Wash Solution (0.35 ml per well) and blot it.
10) Add 200 μl of Substrate Solution into each well. Avoid exposing the Microtiter Plate to direct light. (Covering the plate with e.g. aluminium foil is recommended.)
11) Incubate the plate at room temperature for 15 minutes, shaking at ca. 150 rpm on an orbital microplate shaker. (The incubation time begins after the first TMB addition).
12) Stop the colour development by adding 100 μl of Stop Solution into each well.
13) Determine the absorbance by reading the plate at 450, 405 and 630 nm (as a reference). The absorbance must be read within 20 minutes following step 12.

Note: Manual washing: Aspirate wells and pipet 0.35 ml Wash Solution into each well. Aspirate wells and repeat twice. After final wash, invert and tap the plate strongly against paper towel. Make certain that Wash Solution has been removed entirely.

*Figure 1: Example of a work sheet.*
12. CALCULATIONS

In order to obtain a better sensitivity, the present method employs spectrophotometric reading at two wavelengths (450 and 405 nm). For all O.D. overflow at 450 nm, multiply the O.D. 405 nm by the correction factor calculated by the ratio between O.D. 450 nm and O.D. 405 nm. To establish this factor, use a sample reading at 405 and 450 nm.

Most microplate readers perform automatic calculations of analyte concentration. The standard curve is constructed by plotting the mean absorbance (Y) of Calibrators against the known concentration (X) of Calibrators in logarithmic scale, using the four-parameter algorithm. Results are reported as concentration of proinsulin (pmol/l) in samples.

![Human Intact Proinsulin ELISA Calibration Curve](image)

*Figure 2: Typical Calibration Curve for Human Intact Proinsulin ELISA*
13. PERFORMANCE CHARACTERISTICS

Typical analytical data of BioVendor Human Intact Proinsulin ELISA are presented in this chapter.

- **Sensitivity**
The sensitivity was calculated based upon the calibration curve and expressed as the minimal dose showing a significant difference from the Zero Calibrator (mean value + 2 S.D.). This dose is 0.6 pmol/l.

- **Specificity**
Patient samples may contain human anti-mouse antibodies (HAMA), which are capable of giving falsely elevated or depressed results with assays that utilize mouse monoclonal antibodies. This assay has been designed to minimize interference from HAMA-containing specimens with the use of blocking HAMA interferences (Blocking Buffer). Nevertheless, complete elimination of this interference from all patient specimens cannot be guaranteed. A test result that is inconsistent with the clinical picture and patient history should be interpreted with caution.

- **Cross-reactivity**
The antibodies used in the Human Intact Proinsulin ELISA kit are highly specific to human intact proinsulin.

The following peptides were tested and no cross-reactivity has been observed:

- Human Insulin: < 10 000 pmol/l
- Human C-Peptide: 50 000 pmol/l
- Des (31,32)-Proinsulin: < 200 pmol/l
- Split (32,33)-Proinsulin: 5 000 pmol/l
- Des (64,65) -Proinsulin: 200 pmol/l
- Split (65,66) -Proinsulin: 1 000 pmol/l

Sera of several mammalian species were measured in the assay. See results below. For details please contact us at info@biovendor.com.

14. **METHOD COMPARISON**

The BioVendor Human Intact Proinsulin ELISA was compared to commercial immunoassay (ELISA, supplier: A), measuring 72 serum samples, with the following results:

Figure 3: Method comparison

![Figure 3: Method comparison](image)

- \( y = 1.109x + 2.5849 \)
- \( R^2 = 0.8784 \)
15. TROUBLESHOOTING AND FAQS

 Weak signal in all wells
Possible explanations:
- Omission of a reagent or a step
- Improper preparation or storage of a reagent
- Assay performed before reagents and samples were allowed to warm up at room temperature
- Inadequate laboratory temperature
- Reagents exposure to excessive temperature

 High signal and background in all wells
Possible explanations:
- Improper or inadequate washing
- Overdeveloping; incubation time should be decreased before addition of Stop Solution
- Inadequate laboratory temperature
- Reagents e.g. Substrate Solution is contaminated with oxidative active substances

 High coefficient of variation (CV)
Possible explanation:
- Improper or inadequate washing and aspiration of fluid
- Non-homogenous sample after thawing
- Insufficient mixing of reagents and samples before use
- Hemolytic or chylosus sera, turbidity, particles or high lipid content of the sample
- Carry over between samples/calibrators and/or using of the same tip to pipette different reagents
- Unequal volumes added to the wells

 Drift
Possible explanation:
- Inadequate rpm of orbital shaker
- Inadequate rehydration volume for the calibrators
- Reagents exposure to bacterial contamination
- Expiration date for the reagent exceeded
