1. Introduction and Principle of the Test

Homoarginine is a non-essential cationic amino acid, which is formed from lysine. In vitro and in vivo, homoarginine shows characteristics similar to arginine. Epidemiological investigations in two large independent cohorts, namely the German diabetes dialysis (4D) - study and the Ludwigshafen Risk and Cardiovascular Health (LURIC) - study have identified homoarginine as useful predictor of cardiovascular events and mortality.

Beyond that homoarginine concentrations are directly correlated with kidney function and are significantly associated with the progression of chronic kidney disease (CKD). Low homoarginine concentrations might be an early indicator of kidney failure and a potential target for the prevention of disease progression which needs further investigations. Furthermore homoarginine could be a useful marker for the monitoring of hemodialysis patients.

We offer a competitive Homoarginine-ELISA using the microtiter plate format. The correlation of the ELISA method to LC-MS is exceptionally good. No interferences with any therapeutic drugs are observed. The ELISA method allows the measurement of large series of patient samples.

Homoarginine as a biomarker for the risk of mortality is applied for a patent. EP2533653A1 and US20130143240.

The competitive Homorarginine-ELISA uses the microtiter plate format. Homoarginine is bound to the solid phase of the microtiter plate. Homoarginine in the samples is acylated and competes with solid phase bound Homoarginine for a fixed number of rabbit anti-Homoarginine antiserum binding sites. When the system is in equilibrium, free antigen and free antigen-antiserum complexes are removed by washing. The antibody bound to the solid phase Homoarginine is detected by anti-rabbit/peroxidase. The substrate TMB / peroxidase reaction is monitored at 450 nm. The amount of antibody bound to the solid phase Homoarginine is inversely proportional to the Homoarginine concentration of the sample.
2. **Precautions**

- For in vitro use only.
- Some reagents contain sodium azide as preservative (<0.1%). Avoid skin contact.
- Material of animal origin used in the preparation of the kit have been obtained from certified healthy animals but these materials should be handled as potentially infectious.

3. **Storage and Stability**

On arrival, store the kit at 2-8 °C. Once opened the kit is stable until its expiry date. For stability of prepared reagents refer to Preparation of Reagents. Do not use components beyond the expiration date shown on the labels. Do not mix various lots of any kit component within an individual assay.
4. Contents of the Kit

4.1 MT-Strips

8 wells each, break apart precoated with Homoarginine

4.2 Standards 1 - 6

Each 4 ml, ready for use

Concentrations:

<table>
<thead>

4.3 Control 1 & 2

Each 4 ml, ready for use
Range: see q.c. certificate

4.4 Acylation Buffer

3.5 ml, ready for use

4.5 Acylation Reagent

Lyophilised, dissolve content in 3 ml Solvent before use

4.6 Solvent

5.5 ml, contains DMSO

4.7 Antiserum

7 ml, ready for use
Rabbit-anti-N-acyl-Homoarginine

4.8 Enzyme Conjugate

13 ml, ready for use
goat anti-rabbit-IgG-peroxidase

4.9 Wash Buffer

20 ml, concentrated (50x)

4.10 Substrate

13 ml TMB solution, ready for use
4.11 **Stop Solution**  
*STOP*  
13 ml, ready for use  
Contains 0.3 M sulphuric acid, not corrosive  

4.12 **Reaction Plate**  
*ACYL-PLATE*  
1 piece  
for acylation  

4.13 **Equalizing Reagent**  
*EQUA-REAG*  
1 vial  
lyophilized, dissolve content with 21 ml dist. water,  
dissolve carefully to minimize foam formation  

4.14 **Foil**  
*FOIL*  
2 pieces  
Ready for use  

Additional materials and equipment required but not provided:  
- Pipettes (20, 50, 100 and 200 µl)  
- Orbital shaker  
- Multichannel pipette  
- Microplate washing device  
- Microplate photometer (450 nm)  

5. **Sample Collection**  
Repeated freezing and thawing should be avoided.  

**Plasma and Serum**  
The test can be performed with serum as well as with EDTA plasma.  
Hemolytic, ikteric and lipemic samples should not be used.  
The samples can be stored up to 6 hours at 2 - 8 °C. For a longer  
storage (up to 18 months) the samples must be kept frozen at -20 °C  

**Cell Culture Media**  
Cell culture media like DMEM and RPMI have been tested successfully.  
Other media have to be tested by the user.
6. Preparation of Reagents

Microtiter strips \textbf{STRIPS}
Before opening the packet of strip wells, allow it to stand at room temperature for at least 10 minutes. After opening, keep any unused wells in the original foil packet with the desiccant provided. Reseal carefully and store at 2-8 °C.

Wash Buffer \textbf{WASH}
Dilute the content with dist. water to a total volume of 1,000 ml. The diluted wash buffer has to be stored at 2 - 8 °C and can be used for 4 weeks. For longer use until expiry date of the kit store frozen at -20 °C.

Equalizing Reagent \textbf{EQUA-REAG}
Dissolve the content with 21 ml dist. water, mix shortly and leave on a roll mixer or orbital shaker for 20 minutes. Handle carefully in order to minimize foam formation. The reconstituted Equalizing Reagent should be stored frozen at -20 °C and is until expiry date of the kit.

Acylation Reagent \textbf{ACYL-REAG}
Dissolve the content of one bottle in 3 ml Solvent and shake for at least 10 minutes on a rollmixer or orbital shaker. After use the reagent has to be discarded. The Acylation Reagent has always to be prepared immediately before use and is stable for at least 3 hours. The second and third bottle allows a second and third run of the test, respectively. If the whole kit is to be used in one run it is recommended to pool the dissolved contents of two vials of Acylation Reagent.

All other reagents are ready for use.
7. Test Procedure

Bring all reagents to room temperature and mix them carefully, avoid development of foam. Duplicates are recommended for standards, controls and samples.

7.1 Test Procedure for Plasma and Serum

Preparation of Samples (Acylation)

The wells of the reaction plate for the acylation can be used only once. Please mark the respective wells before use (Edding)

1. Pipette each 20 µl standard 1 - 6, each 20 µl control 1 & 2 and each 20 µl patient sample into the respective wells of the Reaction Plate.

2. Pipette 20 µl Acylation Buffer into all wells.

3. Pipette 200 µl Equalizing Reagent into all wells and mix the reaction plate for 10 seconds.

4. Pipette 50 µl of freshly prepared Acylation Reagent each into all wells, continue with point 5. immediately. Colour change to violet.

Attention
Please note that Acylation Reagent reacts with many plastic materials including plastic trays. It does not react with normal pipette tips and with glass devices. Use an Eppendorf multipette or similar, fill the syringe directly from the vial and add well by well.

5. Incubate for 15 minutes at room temperature on an orbital shaker with medium frequency.

Take each 20 µl of the acylated sample for the Homoarginine-ELISA.
ELISA for Plasma and Serum

Bring all reagents to room temperature and mix them carefully, avoid development of foam.

1. Pipette each 20 µl prepared Standards, controls and samples into the respective wells of the coated microtiter strips.

2. Pipette each 50 µl Antiserum into all wells.

3. Cover the plate with adhesive foil and incubate for 90 minutes at room temperature (20 – 25 °C) on an orbital shaker with medium frequency.

4. Discard or aspirate the contents of the wells and wash with each 300 µl prepared Wash Buffer. Discard or aspirate the contents of the wells and remove residual liquid by tapping the inverted plate on clean absorbent paper. Repeat the washing procedure 4 times.

5. Pipette each 100 µl enzyme conjugate into all wells.

6. Incubate for 25 minutes at room temperature on an orbital shaker with medium frequency.

7. Repeat step 4.

8. Pipette each 100 µl Substrate into all wells.

9. Incubate for 25 ± 5 minutes at room temperature on an orbital shaker with medium frequency.

10. Pipette each 100 µl Stop Solution into all wells and mix briefly.

11. Read the optical density at 450 nm (reference wavelength between 570 and 650 nm) in a microplate photometer.
7.2 Test Procedure for Cell Culture Samples

The sample preparation of cell culture samples and subsequent ELISA has to be done separately and cannot be performed in parallel to the plasma and serum samples.

Preparation of Samples (Acylation)

The wells of the reaction plate for the acylation can be used only once. Please mark the respective wells before use (Edding)

1. Pipette each 20 µl standard 1 - 6, each 20 µl control 1 & 2 and each 20 µl cell culture sample into the respective wells of the Reaction Plate.

2. Pipette 20 µl standard 1 in all wells containing cell culture samples (compensation for matrix).

3. Pipette 20 µl cell culture medium into all wells containing standards and controls (compensation for matrix). Do not pipette into wells with cell culture samples.

4. Pipette 20 µl Acylation Buffer into all wells.

5. Pipette 200 µl Equalizing Reagent into all wells and mix the reaction plate for 10 seconds.

6. Pipette 50 µl of freshly prepared Acylation Reagent each into all wells, continue with point 7. immediately. Colour changes to violet.

Attention
Please note that Acylation Reagent reacts with many plastic materials including plastic trays. It does not react with normal pipette tips and with glass devices. Use an Eppendorf multipette or similar, fill the syringe directly from the vial and add well by well..

7. Incubate for 15 minutes at room temperature on an orbital shaker with medium frequency.

Take each 20 µl of the acylated sample for the Homoarginine-ELISA.
ELISA for Cell Culture Samples

Bring all reagents to room temperature and mix them carefully, avoid development of foam.

1. Pipette each 20 µl prepared Standards, controls and samples into the respective wells of the coated microtiter strips.

2. Pipette each 50 µl Antiserum into all wells.

3. Cover the plate with adhesive foil and incubate for 90 minutes at room temperature (20 – 25 °C) on an orbital shaker with medium frequency.

4. Discard or aspirate the contents of the wells and wash with each 300 µl prepared Wash Buffer. Discard or aspirate the contents of the wells and remove residual liquid by tapping the inverted plate on clean absorbent paper. Repeat the washing procedure 4 times.

5. Pipette each 100 µl enzyme conjugate into all wells.

6. Incubate for 30 minutes at room temperature on an orbital shaker with medium frequency.

7. Repeat step 4.

8. Pipette each 100 µl Substrate into all wells.

9. Incubate for 30 ± 5 minutes at room temperature on an orbital shaker with medium frequency.

10. Pipette each 100 µl Stop Solution into all wells and mix briefly.

11. Read the optical density at 450 nm (reference wavelength between 570 and 650 nm) in a microplate photometer.
8. Calculation of the Results

On a semilogarithmic graph paper the concentration of the standards (x-axis, logarithmic) are plotted against their corresponding optical density (y-axis, linear). Cubic spline, 4 parameter or similar iteration procedures are recommended for evaluation of the standard curve. The concentration of the controls and samples can be read directly from this standard curve by using their average optical density.

Typical standard curve:

![Typical standard curve graph]

\[
y = \frac{(A - D)}{1 + (\frac{x}{C})^B} + D
\]

<table>
